

### **Data-Matrix-Reader sees through paint and grime**

The Locus Data-Matrix Reader from DolphiScan is the first reading device in the world to require no contrast when reading a 2 D code. Even a painted-over code can be decoded. This is only possible because the reader works ultrasonically and uses no optical components. It is thereby also possible to read codes which have been covered in grime or paint. The Data-Matrix Reader can be connected to a Windows PC or a PDA via a USB connector. The code is then interpreted via special software, which can also be linked to a variety of databases. The data-matrix code, also called 2D code, is mainly used by the aircraft industry. Not only product information but also the entire maintenance during the life-span of the product can be encoded. As a result, the complete "history" of a workpiece is traceable. Depending upon the size, up to 3,600 characters can be encoded and stored in the code. As a result of these advantages, the code is being employed more and more in the automotive and military fields. We would gladly demonstrate this system to you.

### **Röltgen sponsors the Roadbike Cycling Team**

Firma Röltgen has decided to lend its financial support to the newly established Roadbike-team for the year 2009. The team is made up of 20 national and international cyclists, male and female, and will contest the leading places at such classic races as the "Around Cologne" (Germany) and the "De Ronde van Vlaanderen" (Belgium). Additionally, a start is planned in the famous "Ironman" Triathlon in Hawaii. Röltgen will kit the team out with, among other things, complete cycling strips. The team colours will be white, blue and red. On 12.04.2009, the racing team was officially introduced at the offices of Firma Röltgen. A complete overview of the team, the races and the material deployed can be found on the Röltgen-Cycling-Team's Internet page:
